

HOW I DO IT
V4 POSE KIT 77

This is the reference image I used

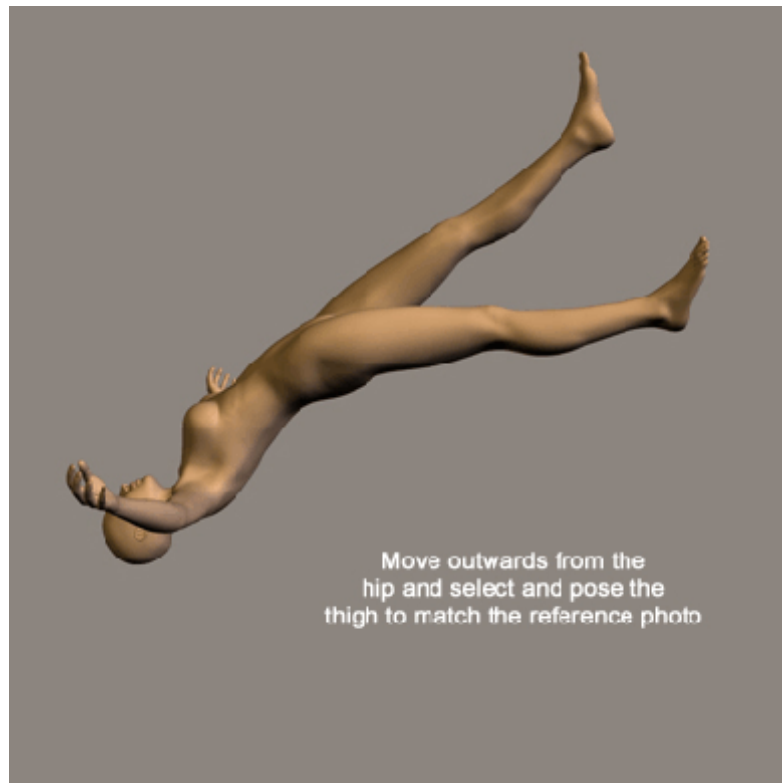

Find a reference photo
(see referencephoto.jpg)

Turn the camera so
it is viewing the hip
area in a similar way
to your reference photo

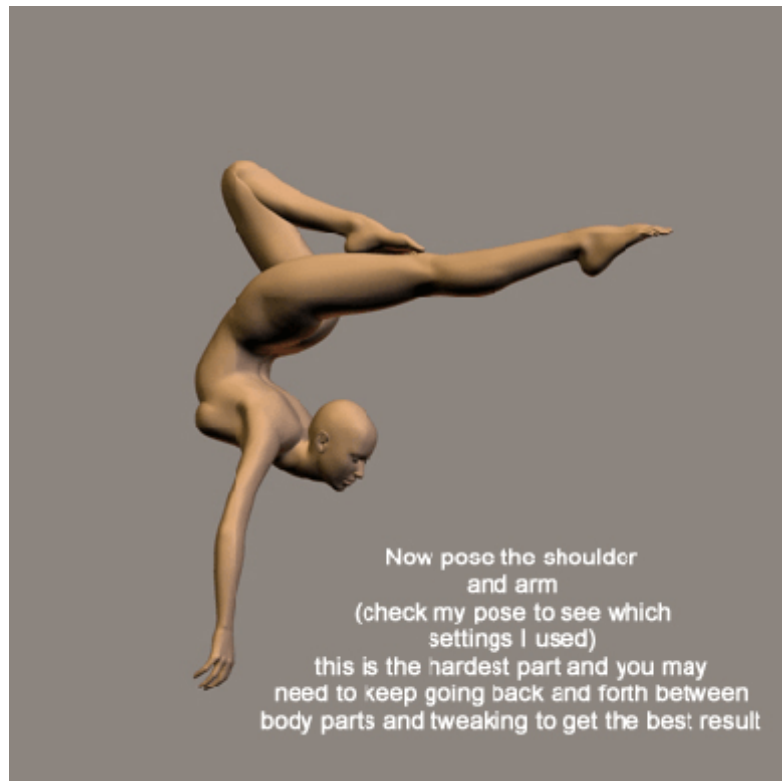

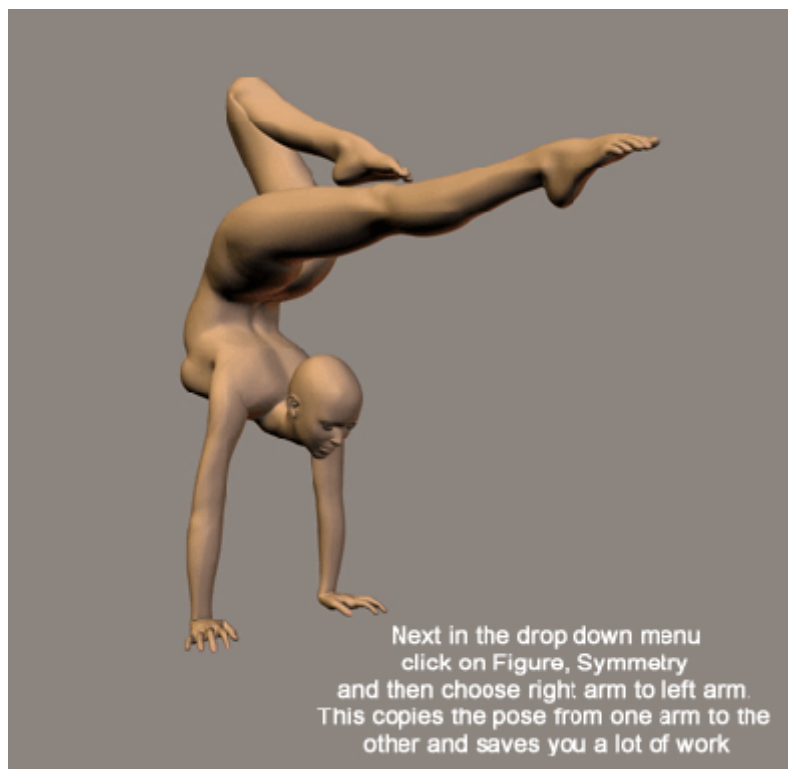

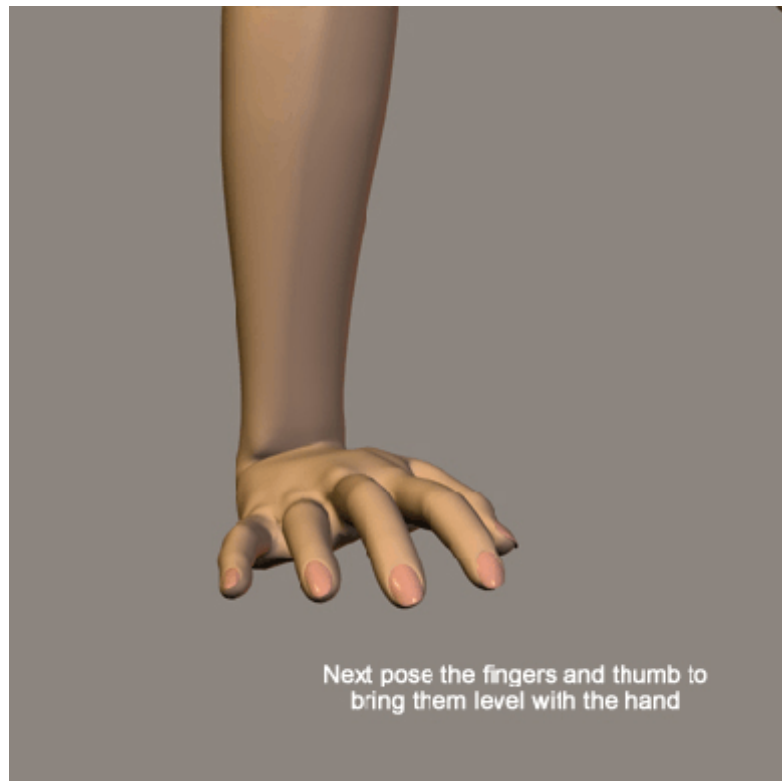

Select and rotate the hip
of the figure to look like
the hip in the reference photo

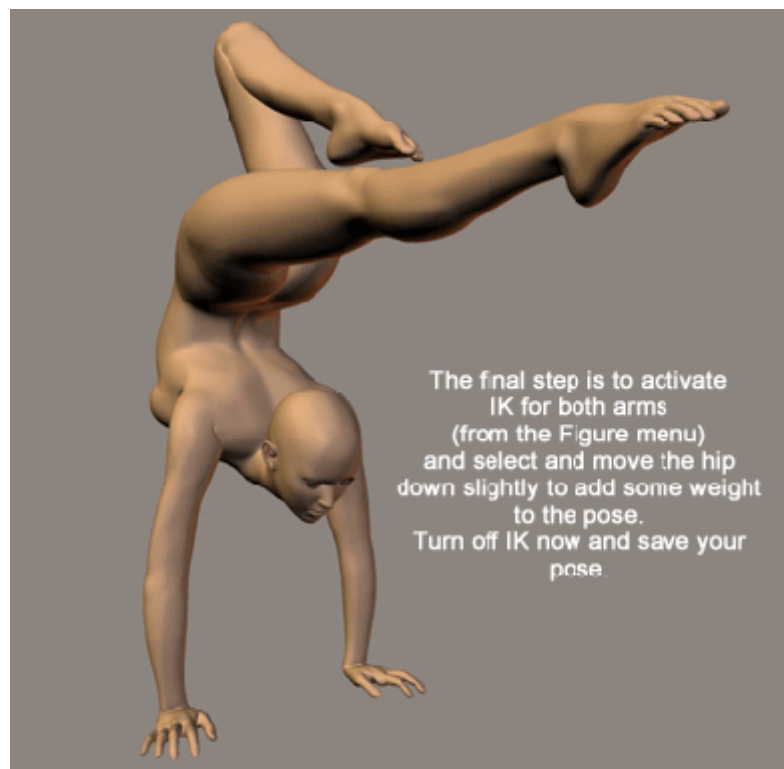

Some important things to remember:

Always begin by posing the hip and work outwards from there, this gives you a solid base to start from.

Use reference photos to learn how body parts should look in a pose

Always pose using the dials, they are more accurate than the other tools.

Use IK to add some weight to your pose and make it a bit more natural.

Use the symmetry option in the Figure menu to copy pose data from one side to the other, this saves you a lot of work and you can always make adjustments after, to make the opposite side a little asymmetrical.

Always bring the figure to the floor at the end by selecting the hip and using the Y trans dial, clicking move to floor doesn't add this data to the pose.

Thanks for viewing this short tutorial, hope you enjoyed it and found it useful.

Cheers, Adam
